About allnex

Facts & Figures

• Global company with over €2.1 billion in sales
• Broad Technology portfolio: liquid coating resins, energy curable resins, powder coating resins, crosslinkers and additives, composites and construction materials
• Approximately 4000 employees
• Customers in more than 100 countries

Energy curing technologies in food packaging applications

Energy curing (UV/EB) technologies have already made significant inroads into non-food applications due to the numerous advantages which they provide over other technologies, e.g., high gloss, excellent resistance properties, high printing speed, fast drying or cure times, no VOC, low system cost.

Penetration of these technologies into food packaging applications, however, is limited. Concerns which are usually quoted are odor and taste transfer, migration of existing resins and of photo-initiators as well as chemicals of concern which are banned by brand owners and/or legislation.

To address above mentioned concerns, allnex is offering low migration resins as well as EBECRYL® LEO resins which are low migration resins with extra features as detailed below:

Improve migration control

Good Manufacturing Processes

‘Good manufacturing practice (GMP)’ means those aspects of quality assurance which ensure that materials and articles are consistently produced and controlled to ensure conformity with the rules applicable to them* and with the quality standards appropriate to their intended use by not endangering human health or causing an unacceptable change in the composition of the food or causing a deterioration in the organoleptic characteristics thereof.

Low migration

Low migration resins are designed for use in printing inks and coatings for indirect food contact.

They are made using selected components which should enable the formulation of low migration inks and coatings.

Those resins are produced under ISO 9001 standards and, similar to the EBECRYL® LEO range, measures are taken against cross contamination.

EBECRYL® LEO resins (Low Extractables and Low Odor)

EBECRYL LEO resins offer valuable options for producing inks and OPVs for indirect food packaging that meet brand owners’ requirements and demanding regulations particularly those intended for use with human foods, pet foods, pharmaceuticals and similar products.

**Key properties**
- Low residual odor after curing and low taste transfer
- Low migration
- Use high purity materials
- Non mutagenic

EBECRYL LEO resins allow for the creation of high performing inks and OPVs with very low migration potential and enhance the ability to achieve high gloss and excellent print quality. They are suitable for a variety of packaging materials, such as labels, lidding films and foils, wrappers and shrink sleeves.

**Raw materials selection**
In order to meet this challenging product profile new qualities of raw materials have been developed with raw material suppliers. Inhibitors with food contact clearance have also been selected.

**Production process**
The Low Extractable / Low Odor (LEO) resins design process includes a master strategy for minimizing the transfer of acrylates from the packaging matrix. This is based on increasing the size and cross-link density of the resin components. This strategy limits the migration of acrylate resins into food, under normal conditions of use, in conformance with e.g. the Swiss Ordinance on Materials and Articles in Contact with Food (SR 817.023.21) often used as “industry standard”.

**Good Manufacturing Processes for EBECRYL® LEO**
EBECRYL LEO resins are produced following Good Manufacturing Practices (GMP).

EBECRYL LEO resins are subject to a stricter quality control process. GMP calls for taking the following measures at all stages during the manufacture of food contact materials:

- **Raw materials** qualities suitable for food contact are selected. Food contact specifications (e.g. special purity criteria) are set-up and documented. Traceability is requested at the supplier site.
- **Specific rules are followed for the manufacturing of the EBECRYL LEO:**
  - A specific layout is adopted for the production log sheets
  - Any deviation from the instructions, recipe or process change is reported to the Product Stewardship and Regulatory Affairs department, which then re-assesses compliance
  - Batch to batch cross contamination is avoided by optimizing the production sequence and/or by producing in campaigns and/or cleaning reactor and piping before production
  - Internal specifications are set and documented on potential contaminants
  - Extra care is taken to avoid contamination of finished products during storage and transport.

**Toxicology for printing inks on the outside of food packaging**
EBECRYL LEO resins have been tested for mutagenicity following OECD guidelines for the testing of chemicals and are considered non-mutagenic based on the “weight of the evidence” of available mutagenicity test results and are considered non-genotoxic.

* Poor/Low  -  ** Very good/High
New generation EBECRYL® LEO self-curing acrylate resin

Migration of low molecular weight photoinitiators into food is a major concern. Therefore, so-called polymeric photoinitiators have been developed for low migration UV inks and coatings. However, they may suffer from poor solubility in acrylates, resulting in poor ink flow and low reactivity which are problematic for high speed offset and flexo printing processes.

To solve these concerns, Allnex introduces its latest development in acrylated binder technology, which does not require an additional photoinitiator, reducing the risk of migration in indirect food contact applications and mitigating performance issues with printability.

Key Properties
- Molecular weight of about 1000 Dalton which is the limit above which a product is of "no toxicological concern"
- Very high purity to avoid low molecular weight impurities and / or residuals prone to migration
- Ability to generate free radicals upon UV irradiation
- No generation of low molecular weight breakdown products
- Build into the acrylate matrix formed during curing of inks or varnishes

EBECRYL LEO 10101* and EBECRYL LEO 10103** allow manufacturers of inks for indirect food contact applications access to high-performance, self-curing resin solutions that eliminate concerns about the migration of low molecular weight photoinitiators.

Self-curing acrylate resins, typically incorporated at 20-30%, do not affect ink flow and are suitable for use in ink formulations with different types of pigments. Finished inks based on EBECRYL LEO 10101 and EBECRYL LEO 10103 have good stability and gloss, similar to those of inks prepared with conventional binders and Pls.

Benefits
- No need for photoinitiators, but possible to combine with photoinitiators when required e.g. in highly concentrated inks
- High reactivity hence suitable for high-speed printing applications
- Liquid with very good compatibility with a wide range of acrylates facilitating use in production

EBECRYL LEO 10101* and EBECRYL LEO 10103** allow manufacturers of inks for indirect food contact applications access to high-performance, self-curing resin solutions that eliminate concerns about the migration of low molecular weight photoinitiators.
