

ULTRATEC[™] VE TIE LAYER 15'

PRODUCT CODE: 066483A

Ultratec[™] VE Tie Layer Resin 15' is prepromoted, thixotropic bisphenol-A epoxy-based vinyl ester laminating resin dissolved in styrene. This resin is suitable for use in hand lay-up, spray-up, and filament winding applications where outstanding mechanical properties and excellent chemical & heat resistance properties are required.

FEATURES

- Tough and versatile
- Excellent Chemical Resistance
- Excellent osmotic blistering resistance

BENEFITS

• Excellent crack and craze resistance

Suitable for construction of barrier laminates directly behind the gelcoat, in marine and swimming pool composites.

APPLICATION

Ultratec[™] VE Tie Layer Resin 15' is ideally suited for construction of barrier laminates/tie layers directly behind the Gelcoat in Marine composites, moulds, swimming pool composites and behind the thermoformed skin in Acrylic Spa Pool mouldings. In Marine & Pool applications, the resin rich tie layer laminate provides excellent resistance to osmotic blistering, and also reduces the surface profile to improve cosmetics of final parts.

In Composite Tooling (Mould) constructions, Ultratec[™] VE Tie Layer Resin 15' laminates applied directly behind the Tooling Gelcoat provide excellent clarity to allow good visibility of entrapped air-bubbles for easy removal via consolidation, prior to application of opaque, filled Ultratec Low shrink Tooling laminates. In the event of damage to the Tooling Gelcoat in service, subsequent Gelcoat and laminate repairs typically show excellent adhesion to the unfilled VE Tie layer laminate. The unique chemical composition of this resin allows fabrication of tough and versatile laminates with excellent crack and craze resistance in moulded parts. Ultratec VE Tie Layer Resin 15' is suitable for mouldings that are subjected to particularly high static or dynamic loads and have excellent resistance to sustained heat.

RECOMMENDED CATALYST

Ultratec[™] VE Tie Layer Resin 15' can be used with a variety of MEKP initiators. However - MEKP types with high Dimer content, such as Norox MEKP 925H are the preferred catalysts for optimum curing.

Norox MEKP 925H also features a very low hydrogen peroxide content which reduces the amount of catalyst fizzing on catalyzation.

When using standard 'Polyester grade' MEKP catalysts, with lower Dimer/Monomer ratios such as Curox M200, Curox NR20, Norox MEKP 9 or Butanox M50, higher levels must be used to ensure satisfactory curing.

For these catalysts, a minimum addition rate of 1.5% catalyst should be used.

Advice on other catalysts can be given on request by your Allnex Composites representative.

POSTCURING

Post curing is recommended to achieve maximum chemical and heat resistance and should be carried out within two weeks of construction. Postcure conditions as outlined in EN 13121-2 are recommended. Minimum recommended postcure conditions are 80°C for four hours.

STORAGE AND HANDLING

To ensure maximum stability and maintain optimum resin handling properties, polyester resins should be stored in closed containers, away from heat sources and sunlight. The resin should be stored away from all sources of ignition. Stored resin quantities should be kept to a reasonable minimum and used on a first in/first out stock rotation basis. Prolonged storage, or unfavourable storing conditions, may cause separation, therefore agitation of the resin before use is recommended.

STANDARD PACKAGING

Mild steel drums (220 kg)

Mild steel pail (20 kg)

Always refer to the MSDS before use
